

PharmaOne AI – Product Description (Updated)

Product purpose, users, AI workflow, Admin Panel, RAG and success criteria.

1. Product Overview

PharmaOne AI is an AI-powered Deviation Intake Module for an API pharmaceutical manufacturing workflow. It converts existing deviation document/text into a structured record, provides AI-assisted impact/severity assessment, lets a user review/edit, and saves the final record.

2. Users

One Admin is manually provisioned. Admin creates demo users. Normal roles: QA Manager, Production User, QC User. These roles share the core Deviation and Reports workflow in this version.

3. User Journey

Login → Dashboard → Deviations → Upload PDF/text → AI extraction → populated form → AI impact/severity assistance → user review/edit → save → Reports.

4. AI Behavior

AI extracts relevant deviation information and provides an initial impact/severity recommendation with a short reason and supporting evidence. The user remains in control; AI does not silently finalize the result.

5. Knowledge/RAG

Knowledge sources may include Form-450 for deviation-form structure, ICH Q9(R1) for risk-management methodology, cGMP/reference documents for manufacturing/quality context, and company SOPs/quality documents for organization-specific procedures and limits.

If these documents are unavailable, the system can still operate with the configured schema, deterministic rules and LLM assistance, with the knowledge layer added later.

6. Admin Panel

Current Admin Panel: create/provision demo users, assign one company/site and one of three roles, activate/deactivate users, and view audit logs. Future versions may add employee registration, company onboarding, approval and invitations.

7. Reports

Reports summarize persisted final reviewed deviations and operational information, not unreviewed AI recommendations.

8. Governance

AI recommendations are decision support. User review/edit is required. Demo risk criteria must be identified as configurable unless backed by an actual company-approved procedure. Audit important user and AI events.

9. Success Criteria

Evaluator can log in as Admin, create a demo user, log in as that user, upload a deviation document, see AI extraction populate the form, receive AI-assisted risk/impact guidance, review/edit it, save the deviation and view it in Reports.
